## 1

## **CONTENTS**

- 1 Stability
  - 1.1 Second order System . . . .
- 2 Routh Hurwitz Criterion
- **3** Compensators
- 4 Nyquist Plot

Abstract—This manual is an introduction to control systems based on GATE problems.Links to sample Python codes are available in the text.

Download python codes using

svn co https://github.com/gadepall/school/trunk/control/codes

## 1 STABILITY

- 1.1 Second order System
  - 2 ROUTH HURWITZ CRITERION
    - 3 Compensators
    - 4 NYOUIST PLOT
- 4.1. Find the cross-over frequency of the given transfer function :

$$G(s) = \frac{100}{(s+1)^3} \tag{4.1.1}$$

**Solution:** The phase crossover is a frequency at which phase angle first reaches -180 degree or at which frequency the imaginary part of denominator of transfer function is equal to zero. The corresponding frequency is the phase crossover frequency.

$$G(j\omega) = \frac{100}{(j\omega + 1)^3}$$
 (4.1.2)

$$=\frac{100}{(1-3\omega^2)+j(3\omega-\omega^3)}$$
 (4.1.3)

Now equating the imaginary part to zero

$$(3\omega - \omega^3) = 0 \tag{4.1.4}$$

$$\implies \omega = \sqrt{3}$$
 (4.1.5)

As phase should be greater than zero for stability.

4.2. Verify using the Nyquist plot.

**Solution:** Use the following matlab code to generate the Nyquist plot in Fig. 4.2

codes/es17btech11019.m

Fig. 4.2

Conclusion: As we can see from the figure, the point where nyquist plot passes is

$$\omega = \sqrt{3} \tag{4.2.1}$$

that is 1.73 and as it is positive so the system is stable.
